

```
docker run --rm -v $PWD:/tmp degauss/geocoder:3.0.2 sample_addresses.csv
```

remove the container  
after it is done

tell docker to  
run a container

mount the current working  
directory to the /tmp  
directory in the container

run the container based on an image,  
defined by owner/name:tag

- owner is always degauss
- name is name of image
- tag is image version number

name of the input csv file in  
the current working directory

*find versions of available images at <https://degauss.org>*
